                                                                                                   SUBUNIT: SYNTHESIZED AS A SINGLE CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE BNIZME IS THEN ACTIVATED BY THROMBIN, WHICH CLEAVES A TETRADECAPEPTIDE FROM THE AMINO BIN OF THE HEAVY CHAIN; THIS REACTION, WHICH OCCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLY PROMOTED BY THROMBONDULLING.
                           TISSUE SPECIFICATY: PLASMA; SYNTHESIZED IN THE LIVER.

PTM: THE VITAMIN R-DEPENDENT, ENZIMATIC CARBOXILATION OF SOME
EDG RELIONS THE MODIFIED FROTEIN TO BIND CALCIUM.

MISCELLANBOUS: CALCIUM ALSO BINDS, WITH STRONGER AFFIXITY TO

ANOTHER SITE, BEYOND THE GLA DOMAIN. THIS GLA-INDEPENDENT BINDING
SITE IS NECESSARY FOR THE RECCGNITION OF THE
THROMBIN-THROMBOMODULIN COMPLEX.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.

SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Blood coagulation; Glycoprotein; Serine protease; Gamma-carboxyglutamic acid; Calcium-binding; Vitamin K; Hydroxylation; EGF-like domain; Repeat; Endothelial cell; Hydrolase; Signal. NON_TER 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to ERA binding domain polypeptides ARG99559-ARG99998 and AAM00010-AAM00021). The era gene in Escherichia coli codes for an essential GFPase protein able to autophosphorylate at serine and/or threonine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or
                                                       (AAG95559-AAG99999 and AAM00010-AAM00021). The era gene in Escherichia coli codes for an essential Grease protein able to autophosphorylate at serine and/or incenine residues. The protein has potential antimicrobial and antibacterial activity and is useful in screening for antagonists, agonists and for compounds with antibiotic activity. The proteins are also useful in determining their role in pathogenesis of infection, dysfunction and disease and could be used as part of a vaccine and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (II) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3.50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activity (half

The N terminal amino acids of the peptides of AAR29095-96 are linked by -C(O)-paraphenylene-C(O)-rape and anti-inflammatory effect useful in the treatment of gout, rheumatoid arthritis and other inflammatory diseases and to prevent elastin mediated tissue damage. It can also be used in the treatment of emphysema and adult respiratory distress syndrome.
The N-terminal amino acids of the peptides of AAR29095-96 are linked by -C(0) paraphenylene-C(0). The cpd has an anti-inflammatory effect useful in the treatment of gout, rheumatoid arthritis and other inflammatory diseases and to prevent elastin mediated tissue damage. It can also be used in the treatment of emphysema and adult respiratory distress syndrome.

"Linked via a linking chain such as -CO-phenylene-CO- to the N-terminal of a Cathepsin G inhibiting molecule as described in AAR38410-11"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "May opt. be modified by COCOR, CF2CF3, CF3, CHF2, COOR3, CONHR3, CF2CHR3CONHR, H, alkyl, aryl, aralkyl or COR; where R3 is H, alkyl, phenyl or benzyl and R is OH or alkoxy"
                                                                                                                                                                                                                                                                                               sequences given in AAR38407-09 are elastase inhibiting peptides
                                                                                                                                                                                                                                                                                                                 which were produced by standard peptide synthesis methods. In the context of the invention they are linked via their N-termini to a Cathepsin G inhibiting peptide (see features table). The peptide conjugates may be used to prevent neutrophil-mediated connective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inflammatory disease; prevention; rheumatoid arthritis; emphysema; neutrophil-mediated connective tissue degradation; gout; elastase; inhibition; adult respiratory distress syndrome.
                                                                                                                                                                                                                                                                                                                                                                                      tissue degradation associated with inflammatory diseases eg. gout and rheumatoid arthritis. They may also be used for preventing elastin-mediated tissue damage in the treatment of emphysema and

                                                                                                                                                                                          sequences given in AAR38407-09 are elastase inhibiting peptides
                                                                                                                                                                                                        which were produced by standard peptide synthesis methods. In the context of the invention they are linked via their N-termini to a Cathepsin G inhibiting peptide (see features table). The peptide conjugates may be used to prevent neutrophil-mediated connective tissue degradation associated with inflammatory diseases eg. gout and rheumatoid arthritis. They may also be used for preventing elastin-mediated tissue damage in the treatment of emphysema and
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                   New cathepsin G and elastase inhibitors - prevents connective

Patent No. 6320024

GENERAL INFORMATION

TITLE OF INVENTION: Method for Design of Substances that Enhance Memory and

TITLE OF INVENTION: Improve the Quality of Life

FILE REFERENCE: 2124-310

CURRENT APPLICATION NUMBER: US/09/264,709A

CURRENT APPLICATION NUMBER: 08/79/782

PRIOR FILING DATE: 1999-03-09

PRIOR FILING DATE: 1997-02-07

NUMBER OF SEQ ID NOS: 39

SSOFWARE: Patentin Ver. 2.1

LENGTH: 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
